VimAI

Monday July 23, 2018, by [admin](#)

VimAI enables indoor augmented intelligence by taking advantage of computer vision and machine learning techniques. We use commercial devices like mobile phones to scan the indoor environments and build 3D models. With the information extracted from the visual data, we can implement object recognition, scene understanding ect. We can further map the recognized objects to the 3D space. Based on the understanding of features in 3D spaces, our technology also enables high precision indoor localization and navigation.
